|-------------------|--------------------------|
| <b>Name</b>       | V S R VINAY VARMA        |
| <b>SRN</b>        | PES1UG24AM317            |
| <b>Jira Space</b> | PES1UG24AM317_VINAYVARMA |

### Submission Evidence

This document compiles the Jira screenshots provided for the lab, including Epics, backlog priorities and story points, sprint progress, sprint completion, burndown charts, and reflection.

# 1. EPICS

The Jira workspace contains five major functional Epics for the Hall Optima system.

**Epics visible in Jira:** Hall Management, Hall Booking, User Management, Booking Management, and Payment Management.

## 2. BACKLOG, PRIORITY & STORY POINTS

The backlog screenshot shows the user stories grouped under their parent Epics. Priority and story-point values are visible for the stories.

The displayed backlog includes stories such as Add Hall, Update Hall, View Hall, Delete Hall, Search Available Halls, View Hall Details, Book Hall, Cancel Booking, User Registration, User Login, Manage User Profile, Manage Users, View/Update/Confirm/Cancel Booking, and payment-related stories.

### 3. SPRINT 1 – SIMULATED PROGRESS

The screenshots show Sprint 1 being simulated by moving selected work items through To Do, In Progress, and Done.

The board snapshot shows work distributed between To Do and In Progress, with the Done column initially empty in this stage.

The later snapshot shows completed work in the Done column while remaining stories stay in To Do.

## 4. SPRINT 2 – SIMULATED PROGRESS

The second sprint was also simulated by progressing selected stories on the Jira board.

A later board state shows the selected stories completed in the Done column.

## 5. BURNDOWN CHARTS

Jira's Sprint Burndown Chart uses story points as the estimation field. The red line represents remaining work, while the grey guideline represents the ideal linear burn rate.

### Sprint 1

### Sprint 2

## 6. REFLECTION QUESTIONS

### 1. Did your estimations reflect the actual effort?

The story-point estimates provided a useful relative measure of effort and complexity. The sprint simulation also showed that some items could be completed quickly while larger estimates required more attention. Overall, the estimates were useful for planning, although actual effort can vary during execution.

### 2. Was your backlog well-prioritized?

Yes. The backlog was assigned High, Medium, and Low priorities according to the relative importance of the work. Higher-priority user stories were selected for the sprint simulation, while the remaining work stayed in the backlog.

### 3. How did your simulated sprint align with your plan?

The simulation followed the planned Scrum workflow: selected stories were placed into the sprint and moved through To Do, In Progress, and Done. The sprint board provided a clear view of progress and remaining work.

### 4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed how quickly story points were being removed from the sprint. It provides a visual comparison between remaining work and the ideal burn rate, helping identify whether the team is progressing as planned and whether the committed workload is realistic.

## 7. CONCLUSION

The Jira workspace demonstrates the main Agile/Scrum activities required for Lab 2: creating Epics and User Stories, prioritizing and estimating backlog items, running two simulated sprints, progressing work across the Scrum board, and reviewing burndown charts.
